A chimera is a living being composed of cells mixed together from two different organisms, either from the same or different species. Scientific research currently uses chimeras in the form of *humanized mice* to study inflammatory disease, cancer, infectious disease, and hematopoiesis. By adding thymus and liver cells from an aborted human fetus to a living mouse, its immune system is transformed facilitating research studies. Humans and animals have mixed throughout the Ages in various ways; so, beyond an initial repulsion, what makes a chimera, a human-animal melding, so morally controversial, so potentially threatening to life on Earth?
