

Technological Medicine – Frequency and Hyperthermia Devices for Improved Health

By Caroline Knight

"What cannot be cured with medicines can be cured with surgery. What cannot be cured with surgery can be cured with hyperthermia." Hippocrates

Frequency and hyperthermia devices are finally becoming better known since (in the UK) Chelsea and West Ham football clubs started using them to drastically reduce recovery times after injury. Another benefit was the substantial or entire reduction of pain. Have you ever wondered why sportsmen like David Beckham recover so quickly from injuries? Beckham started using hyperthermia when he played with Real Madrid in the 1990s.

A great example of this equipment is the Tesla Pro, a highly advanced Radio-Frequency hyperthermia device that uses electrodes to raise the temperature of the part of the body being treated. This increase in temperature creates a localized fever that pathogens find impossible to survive within. Frequencies are regularly used in heating. One example would be microwave ovens, although these are commonly thought to be detrimental to human health. The Tesla Pro uses safe frequencies found in the medium-wave radio band. By creating a localized artificial fever, hyperthermia encourages the destruction of viruses and bacteria. Earlier devices employing this principle were used in hospitals throughout the World. They were known as Diathermy devices, however, they were removed when more-profitable patented antibiotics became available and hence the norm.

Frequencies can destroy cancer cells in a manner comparable to an opera singer using frequency to crack a glass; German and Spanish hospitals use them regularly in their oncology departments. Other frequencies destroy pathogens, parasites and viruses, eliminate bacterial and fungal infections, provide relief from chronic pain, and stimulate bone healing, among many other things. Interestingly, a cat's purr frequency has been found to speed up healing of bones.

Because this type of device rejuvenates cells, it allows them to function at their optimum capacity, facilitating rapid healing. It can therefore treat virtually any condition imaginable, with consistent historic success. Treatment can be done with or without the assistance of another (depending on the location of the condition within the body) and is painless and relatively effortless. It does not damage healthy cells in any way and causes no unpleasant side effects. Results using this machine are regularly documented as nothing less than profound and having personally experienced a treatment on this machine, I can vouch for its innovative and surprising capabilities. Commonly the Tesla devices are used within the beauty industry to combat issues such as excess fat, wrinkles, varicose veins, stretch marks, scars, and hair loss. But the device's beneficial scope goes way beyond this.

Doctors have also used hyperthermia equipment alongside chemotherapy and radiation treatments. Still, some of these doctors admit that the hyperthermia treatment works better alone. (See hyperthermia cancer treatment discussed at <http://www.youtube.com/watch?v=jF-nm8fi3oo>) Equipment ranges vary, providing more or less the same functionality, but some are easier to use than others and do not require the assistance of doctors.

Another good example of success with hyperthermia can be found at the Valley Cancer Institute in California (<http://vci.org/>), which is producing outstanding results using this approach. The Institute undertakes its treatments in conjunction with radiation, which is not optimal but does allow them to continue to exist. Unsurprisingly, all recorded official successes with hyperthermia have been done with chemotherapy and radiation; it is certainly not difficult to guess why this is.

The Tesla Pro machine's use within the UK alone is really starting to take off, after many patients have had significant success at restoring their health using the machine alone. When combined with good-quality health supplements, the improvement is shown to be accelerated even further. Other operators of the device are convinced that the equipment does not need to be used in conjunction with any allopathic treatments. One such operator in the UK, The Solutions Clinic, thinks that liver cancer is the easiest cancer to treat using the Tesla Pro. With this new technology, one only has to set the temperature to 43 degrees Celsius and apply to the area for forty-five minutes. In this way, people have not only survived liver cancer but obtained a state of health they had not had since their twenties.

And so it has never been more evident that there are alternative, safer methods available to treat historically "incurable" diseases. Equipment is available to purchase or lease, and individual sessions with a trained operator can be booked. For those wishing more information, the links provided below can help you learn about the life-saving treatment that many doctors and medical professionals now believe is the best treatment available.
