

# INTRAVENOUS HYDROGEN PEROXIDE: THE 100-YEAR-OLD CURE FOR COVID -19

By Heidi Osterman, CN

If Hydrogen Peroxide therapy were to work as well in COVID-19 as it did in the Spanish Flu, then the current death rate would be reduced by half, and the number of patients requiring a ventilator would be greatly reduced, or patients may not need one at all.

If you were hospitalized with COVID-19 and learned of a treatment that had been successfully trialed during the World's deadly Spanish Flu pandemic, would you want to try it? If the treatment was also low tech, easy to administer, and didn't require any special testing, had no contraindications, and was readily available, wouldn't it seemingly be the answer to this medical

crisis? A treatment cheap enough for the poorest country to use even in the most primitive of settings, it would be the perfect solution and answer to a global prayer.

Assuming all of this to be true, how would you feel when told that the hospital would not authorize its use?

This is exactly where we are at. This treatment exists, and no, you can't get it in a hospital. The treatment is Intravenous Hydrogen Peroxide Therapy. Your doctor will never have heard of it and certainly did not learn it in medical school. But it does exist and has been quietly and safely used for 100 years now in private clinics around the world. Unpatented treatment options are not favored by conventional medicine, it seems.

Hydrogen Peroxide, commonly used topically to clean wounds and gargled as a mouth disinfectant, can also be used as an intravenous drip to treat infection. In dilute concentrations of 0.03% in a dextrose sugar water solution this treatment is entirely safe and does not cause air embolism.

The human body already produces Hydrogen Peroxide inside the macrophages of the white blood cells as a defense against fungal, bacterial, and viral infections. This is one key step in the immune response of all mammals; nothing new at all.

The intravenous use of Hydrogen Peroxide was pioneered by medical doctors fighting the World's deadliest pandemic to date, the Spanish Flu. The medical officer of the royal infirmary, T. H. Oliver, was stationed in India during the 1919 outbreak. His record and observations were published in *The Lancet*, the top medical journal of the time.

"So useless were the usual remedies tried that we felt justified in giving a trial to any method that held the prospect of success. The mortality of the epidemic may be gauged from the

fact that in one large hospital in which the influenza cases were segregated in special huts the death-rate was over 80%. The first test subject was an E. Indian man who had been delirious for two days previously and was selected as being the worst case in the ward and to all appearances moribund. The patient showed no signs of discomfort during the treatment and the noticeable feature was the steadying and deepening of the respiration and great lessening of discomfort. The temperature fell to normal in the course of the next days. "The change was remarkable, the patient, who previously had to be tied in bed owing to delirium, was in short order sitting up and asking for food; and from that time improved steadily, released as a walking case 3 weeks later. Encouraged by the success we tried the method on 24 others—selecting always those whose condition was apparently hopeless. 10 were delirious at the time of infusion and had to be held down in bed. Three were comatose from toxemia.

**52% of the hopeless cases survived after Hydrogen Peroxide IV drip compared to 80% mortality rate for less ill patents not treated with Hydrogen Peroxide IV drip."**

The astonishing results were recorded and published for posterity in the most prestigious peer reviewed medical journal at that time, *The Lancet*. The title of the paper is "Influenza Pneumonia: The Intravenous Injection of Hydrogen Peroxide," published February 1920 noting, "In view of a further outbreak of influenza accompanied by bronchopneumonia another method of combatting the extreme toxemia and anoxemia (lack of oxygen) appears worthy of record."

There in medical history lies our salvation. 100 years ago doctors noted the worthiness of this treatment. *The Lancet* is still existing as a prestigious journal for doctors today, and your doctor can order a copy of this paper from the medical library.

It is a kind of “message in a bottle” from one generation of doctors to another.

Current references in medical literature abound in the medical literature with titles like “Activation of murine macrophages by hydrogen peroxide” *Elsevier/cellular signaling*\1994 Nov 6, Volume 6, issue 8

“Hydrogen Peroxide inflammation: Messenger, Guide, and Assassin” published in *Advances in Hematology*, 2012, vol 2020, article ID 541471.

Hospitals do not use Hydrogen Peroxide as part of a critical care protocol. It is used in private medical practice by doctors who have taken specialized training in unconventional intravenous treatments. It is time to incorporate these treatments into the hospital system at least for COVID-19 cases. By contrast, President Trump fast-tracked the use of an old drug without clinical trials. A hastily made vaccine has been fast-tracked and skipped animal safety studies and injected into a human. Surely, hospital officials can allow something as old and safe as this treatment.

A prime minister, a president, a royal, or supreme leaders are each capable of executive orders to allow for hanging a few bags of IV Hydrogen peroxide. Under these circumstances, it is not possible to refuse a safe treatment. It is a very simple and cost-effective approach. There is no justification for refusing to try a safe treatment especially in light of the fact that there exists no effective treatment at this time.

Hospitals can start treating COVID-19 patients with this Hydrogen Peroxide therapy as soon as they arrive. One physician, Dr. Wittel, who has safely administered 20,000 of these intravenous treatments is willing to share his experience with medical doctors or government officials to answer questions about the treatment. Dr. Wittel MD, PhD is a licensed medical

doctor and has been administering these intravenous drip solutions of Hydrogen Peroxide treatments for 20 years in Kelowna, BC, Canada. Commonly treatable conditions include viral shingles, diabetic infections that don't respond to antibiotics, lung disease, and chronic bacterial infections associated with cardiovascular disease. He is equally expert at the safe administration of high dose IV Vitamin C which was reportedly used in China with success for COVID-19 by Dr. Mao at a dosage of 10 -20 grams.

The advantage of Hydrogen Peroxide is that you don't need to do the G6PD test that Vitamin C IV requires for certain ethnicities. Both treatments could be utilized since people are dying for lack of treatment; not because of a super deadly virus, COVID-19 is not the problem, 98% of people survive it relatively easily. The lack of proper treatment for hospitalized patients is the problem. We all know that fluids, painkillers, and ventilators are not true treatments. Corticosteroids are a treatment, but it is not enough, antibiotics are not enough. It is time to allow safe, novel treatments to be used in institutional care. Nursing homes could treat in- house, prisons likewise. Started early, a hospital stay may be shortened considerably. These IV treatments are the only treatments that could be used immediately and simultaneously worldwide without difficulty. Someone needs to tell our leaders, and tell President Trump. He could set this situation straight. "Make the World Well Again" is a great slogan.

So, It has come to this: the hospital system must be enabled to provide these strategies. What do we have to lose by trying? It is simple and patients deserve a fighting chance.

If you get sick, ask for IV Hydrogen Peroxide or Vit C in the hospital. You must stand up for your right to try alternative

therapies. Hospital doctors and nurses deserve these treatments too. They should get an IV at the end of every shift.

**This is no time for hospital politics. Hang the bag.**

Preferably before the economy implodes. We can avoid economic ruin and set the World free. It truly can be this simple. Now who is in charge of decision-making on this matter?

Dr. Wittel M.D., PhD, originally an ear, nose, and throat specialist, surgeon, and emergency room doctor, began a private medical clinic in Kelowna, BC in 1998 specializing in IV therapies. As an international speaker, his focus is on mentoring doctors on the correct and safe use of IV protocols.
